NINE-OSCILLATION INLET / SAME SCALAR RANGE, NEW FUNCTION FAMILY
Re=55 | mean inlet=1 | no per-case training | ordinary predictor rejects this inlet

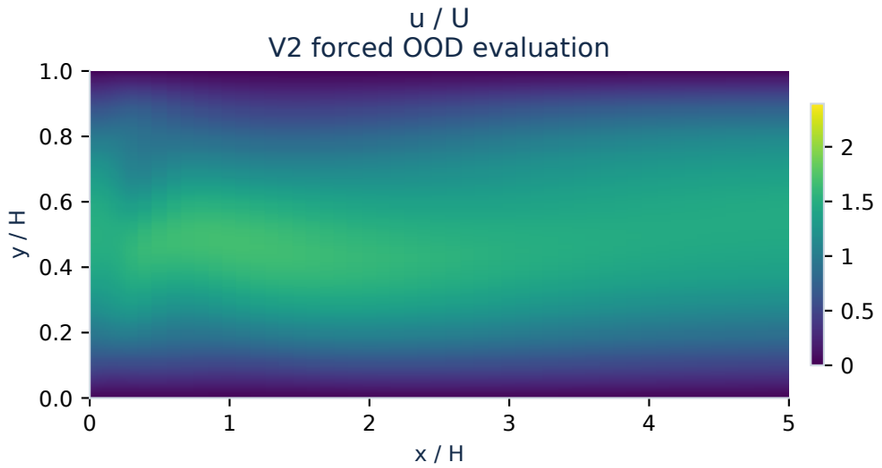

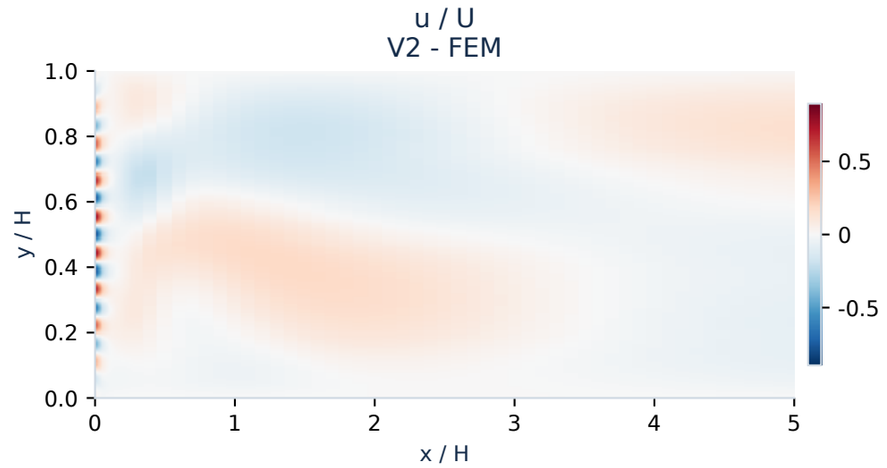

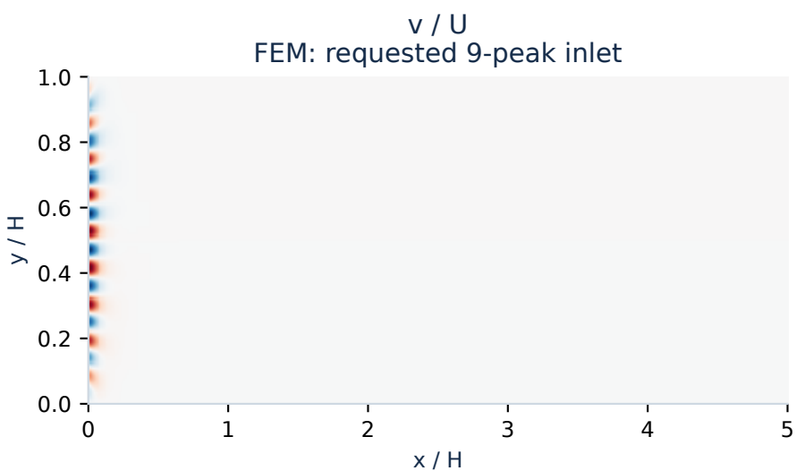

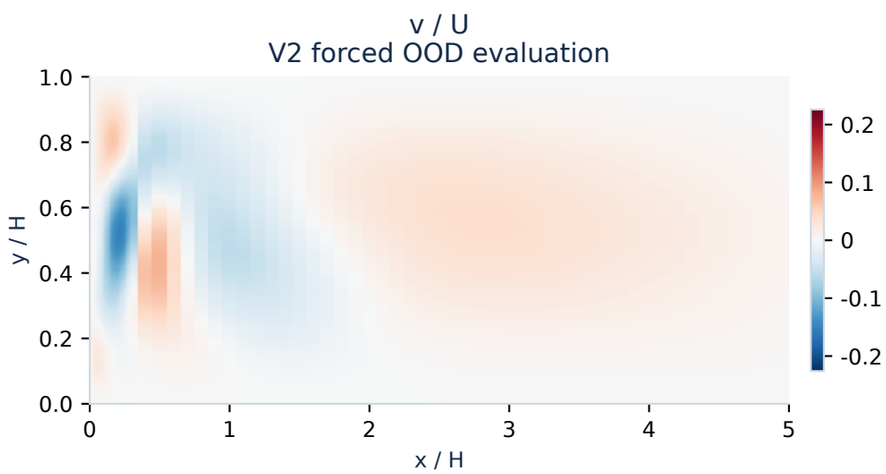

Full-channel comparison
Re=55 | frozen 70k checkpoint | requested inlet is outside the 4-mode family

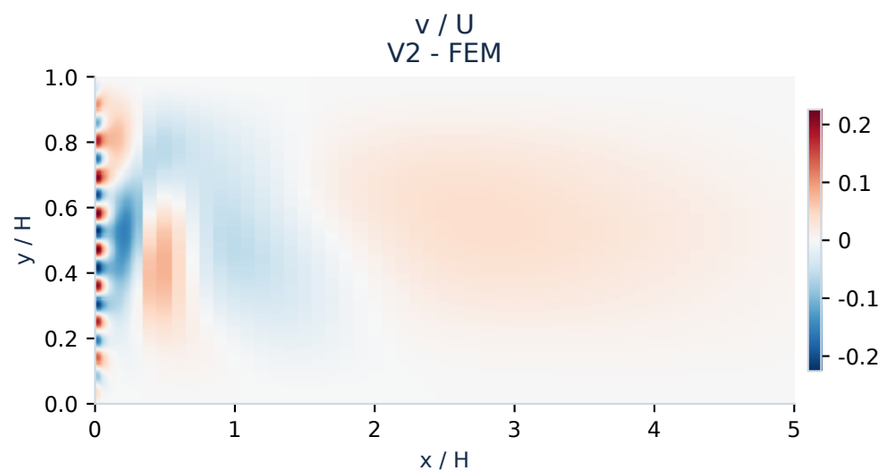

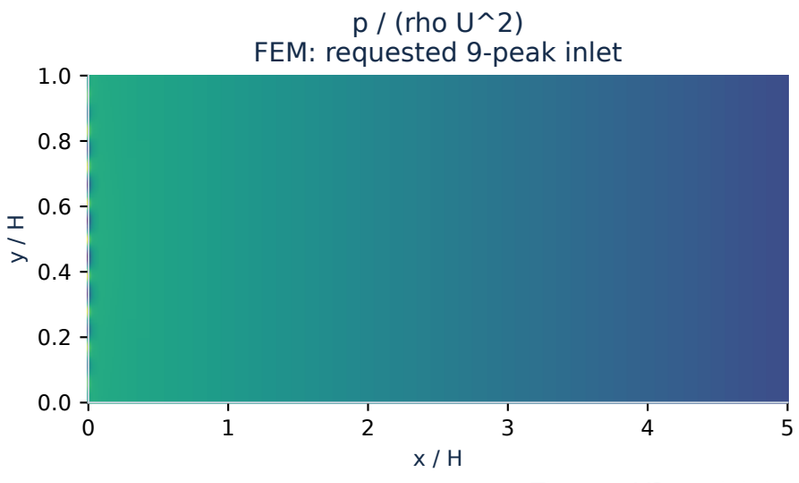

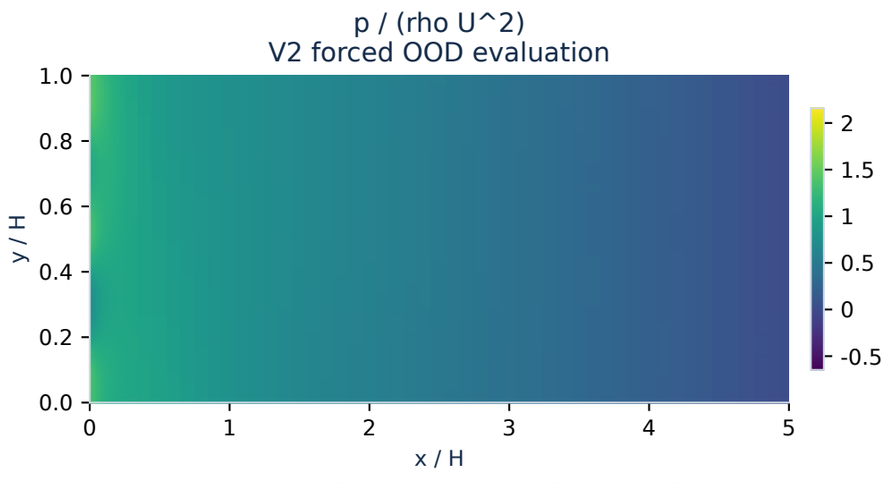

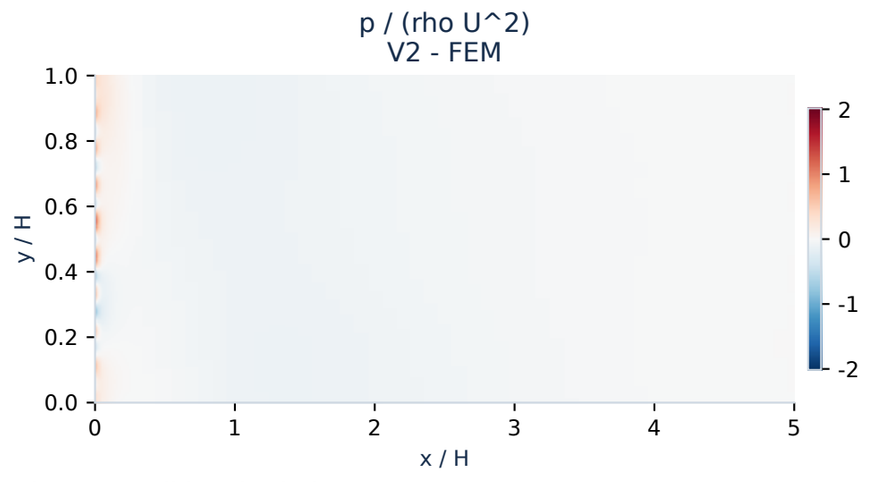

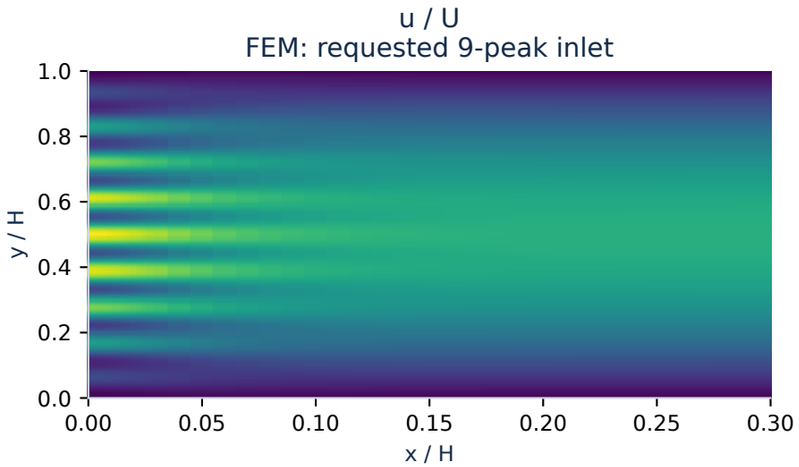

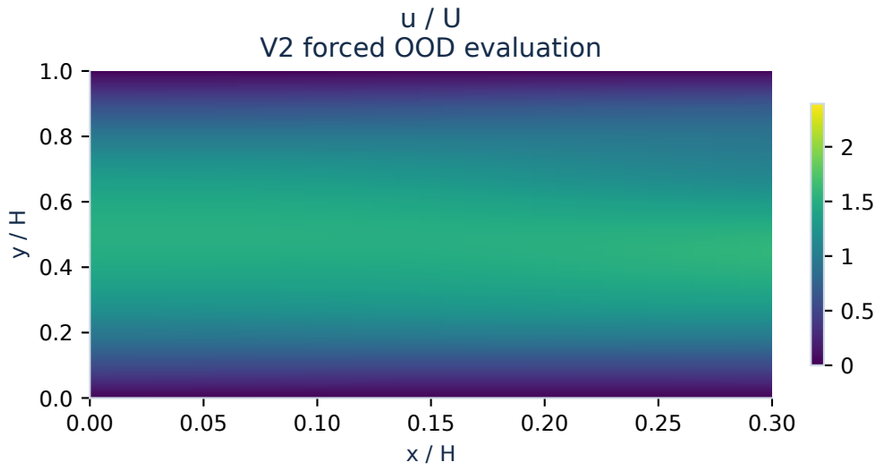

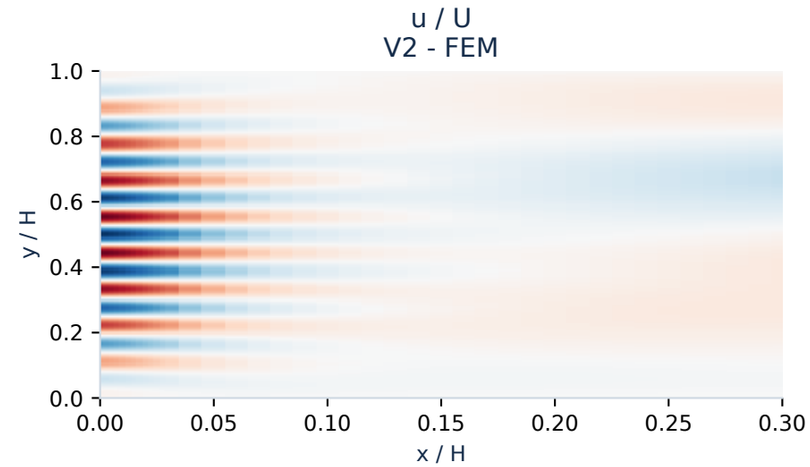

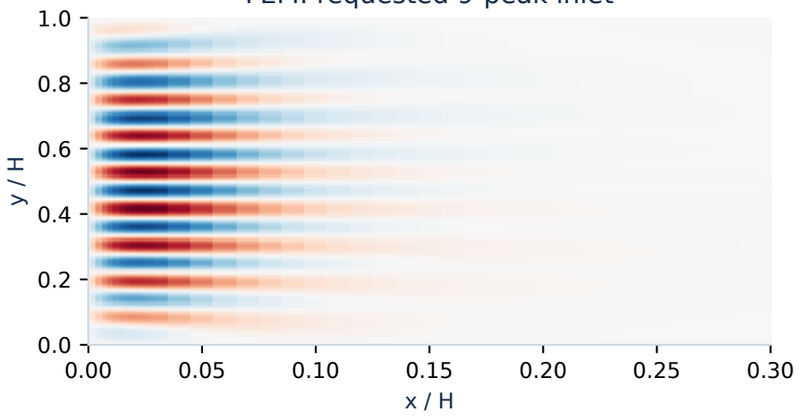

The raw V2 model does not impose the requested 9-peak boundary. This is an OOD failure diagnostic, not a validated solution.

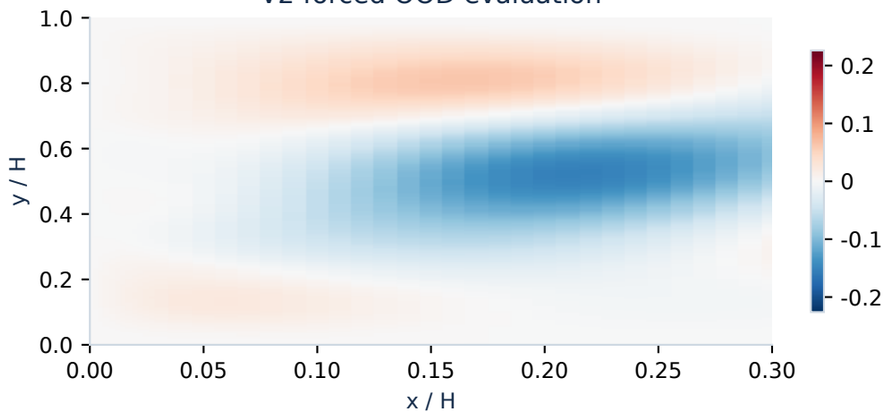

Entrance zoom
Re=55 | frozen 70k checkpoint | requested inlet is outside the 4-mode family

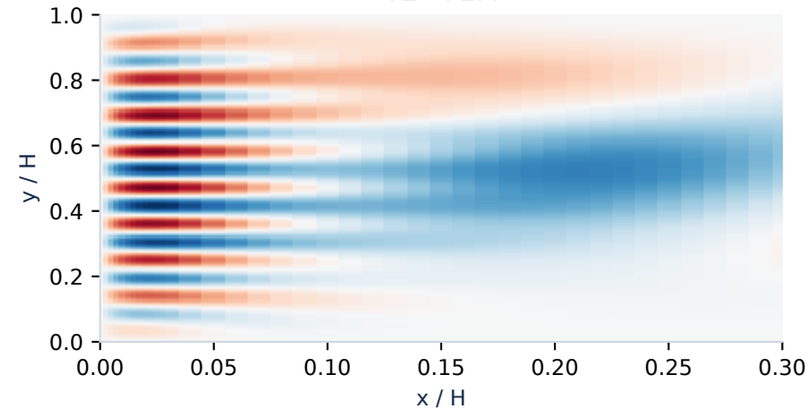

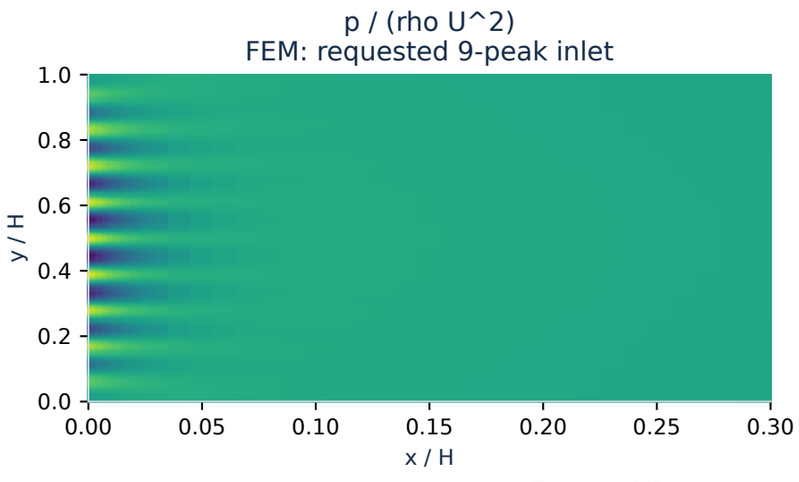

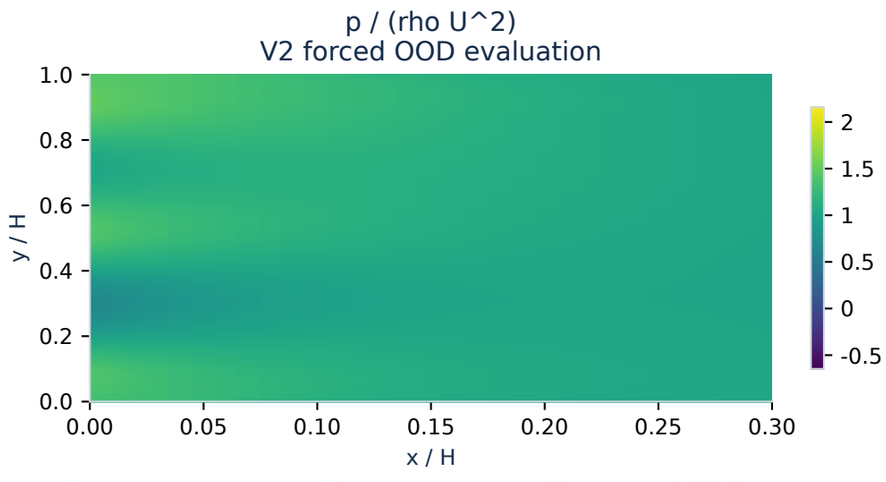

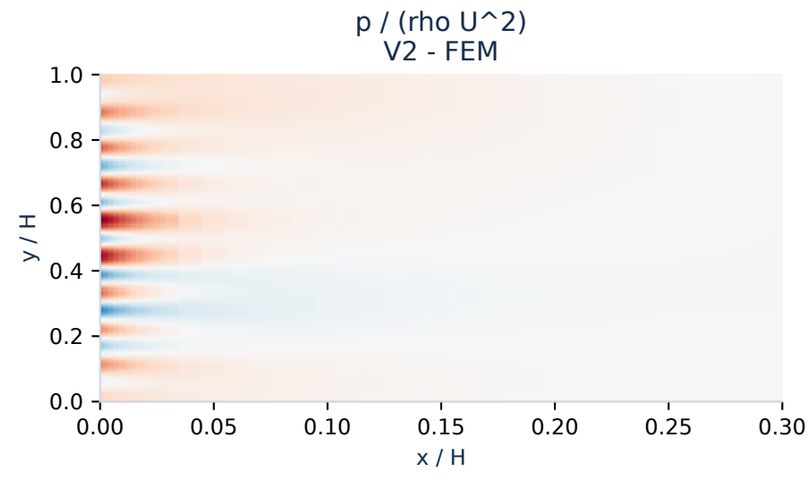

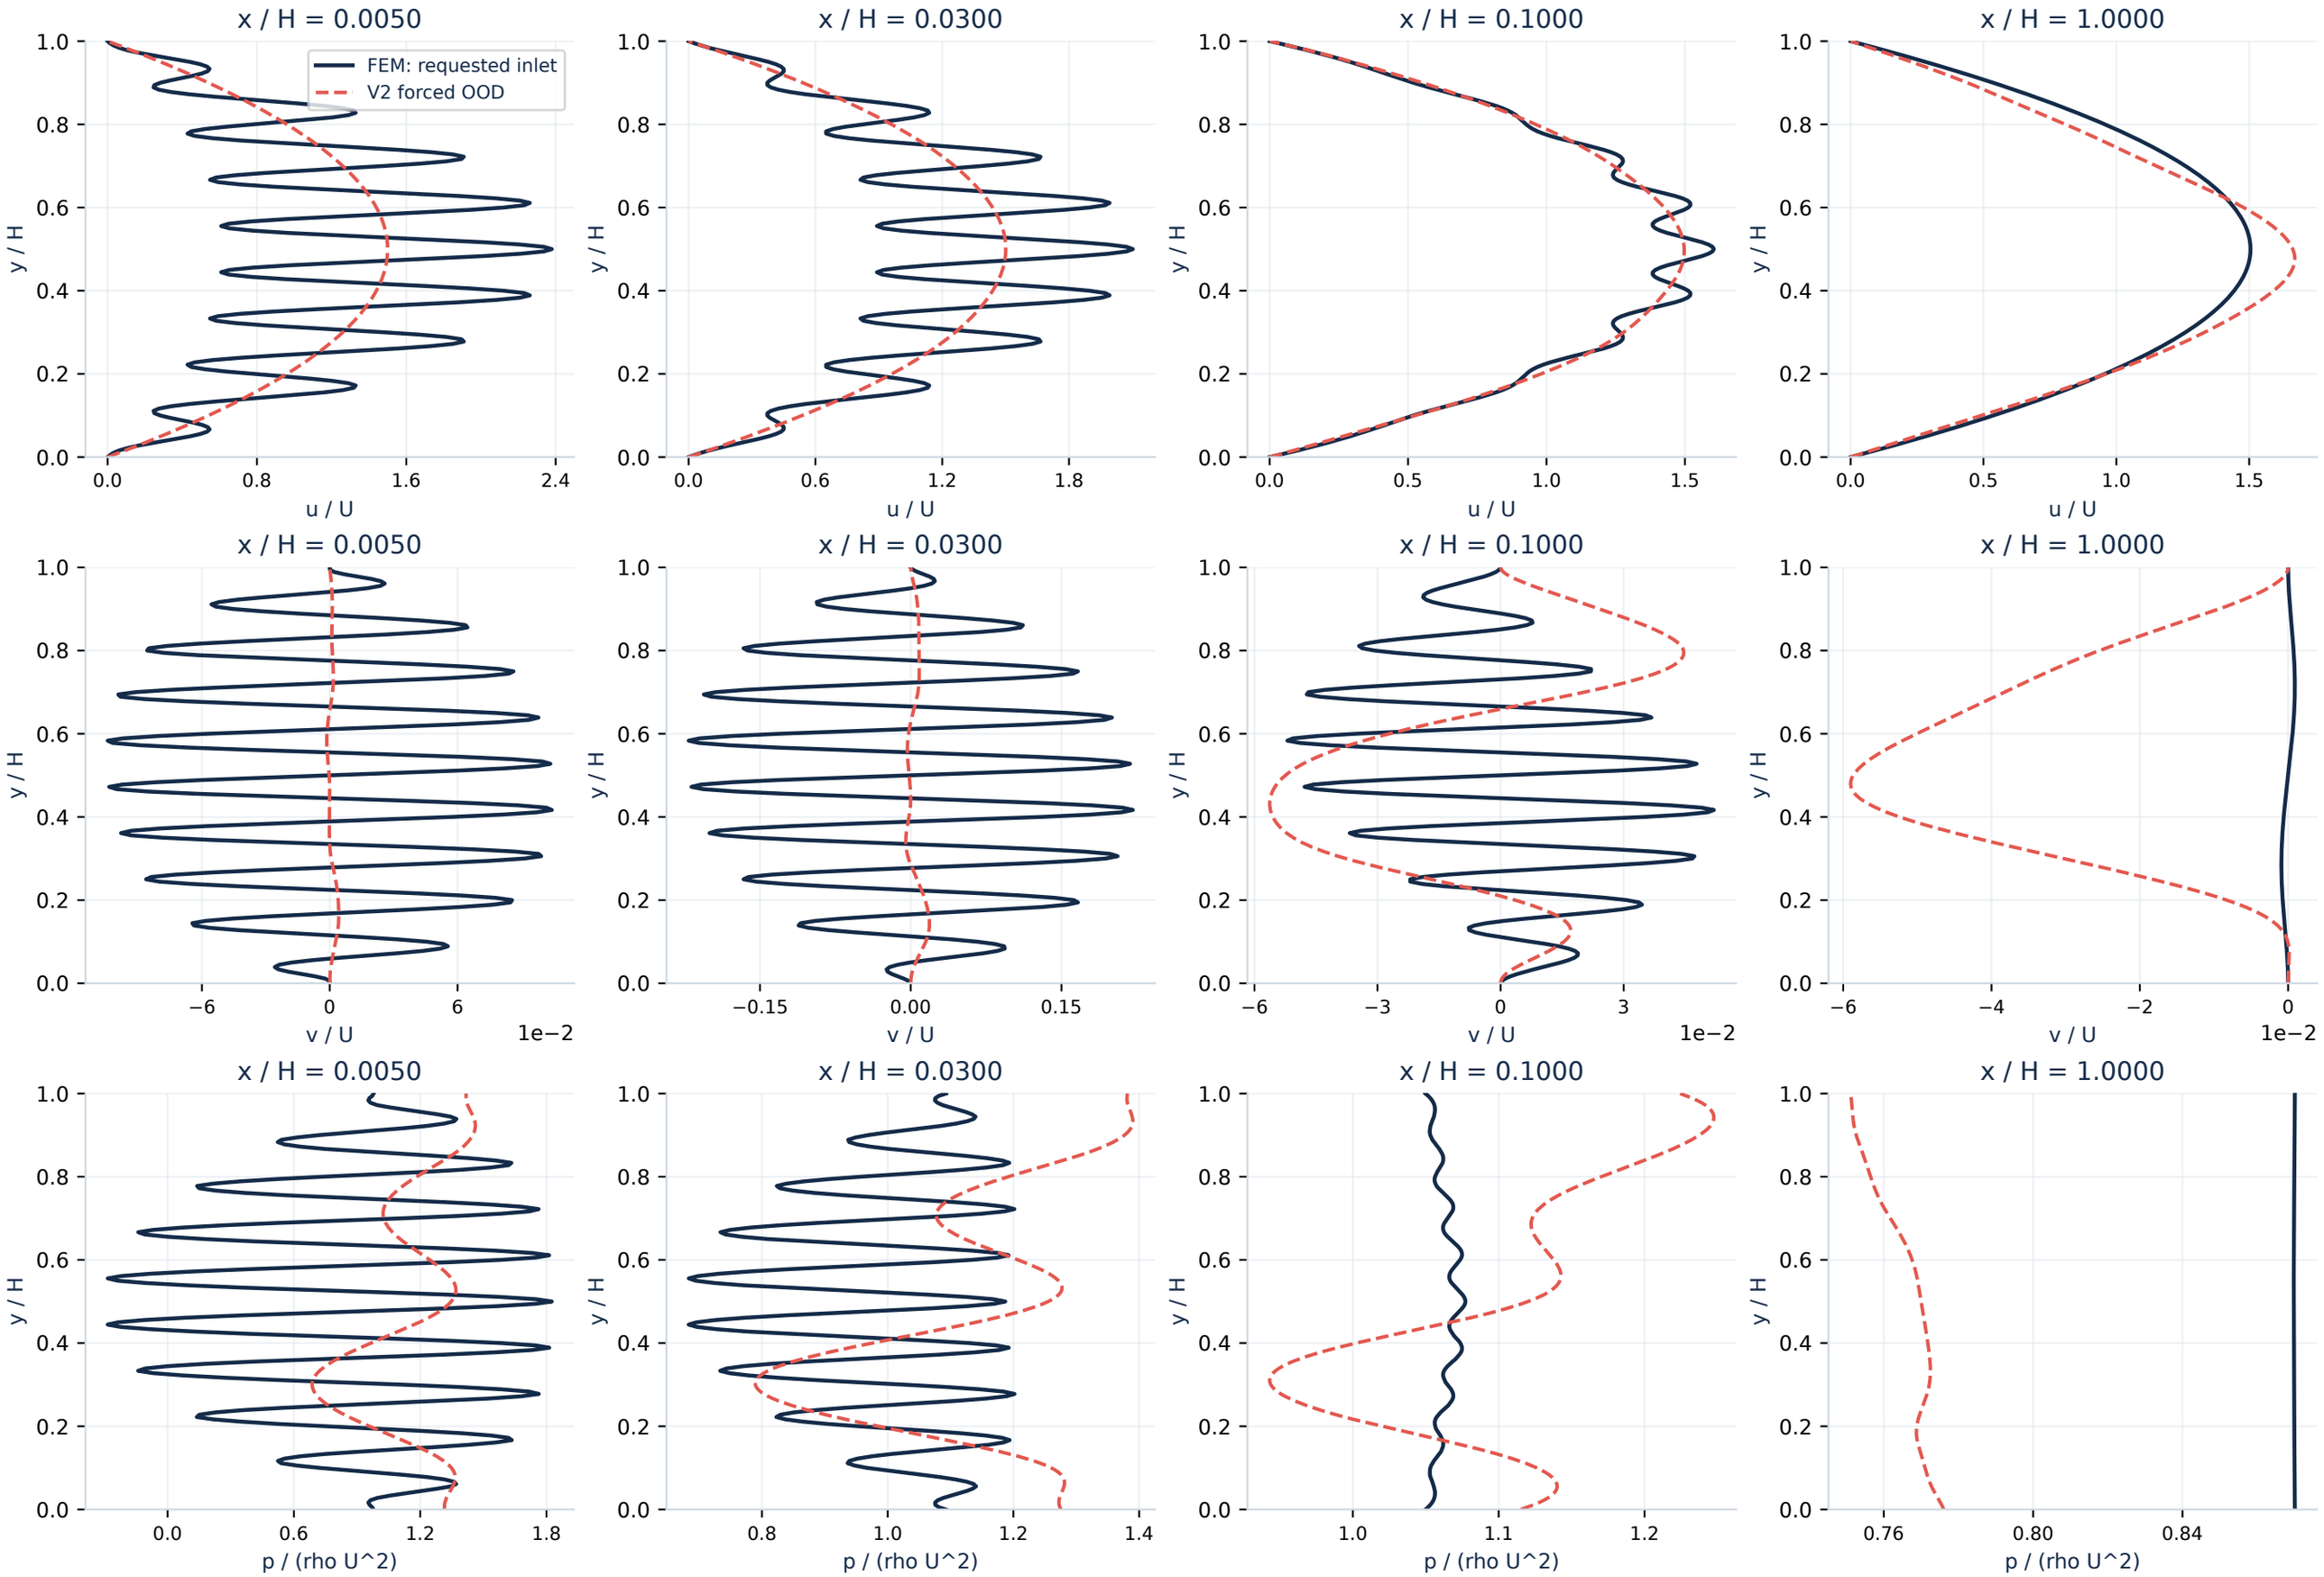

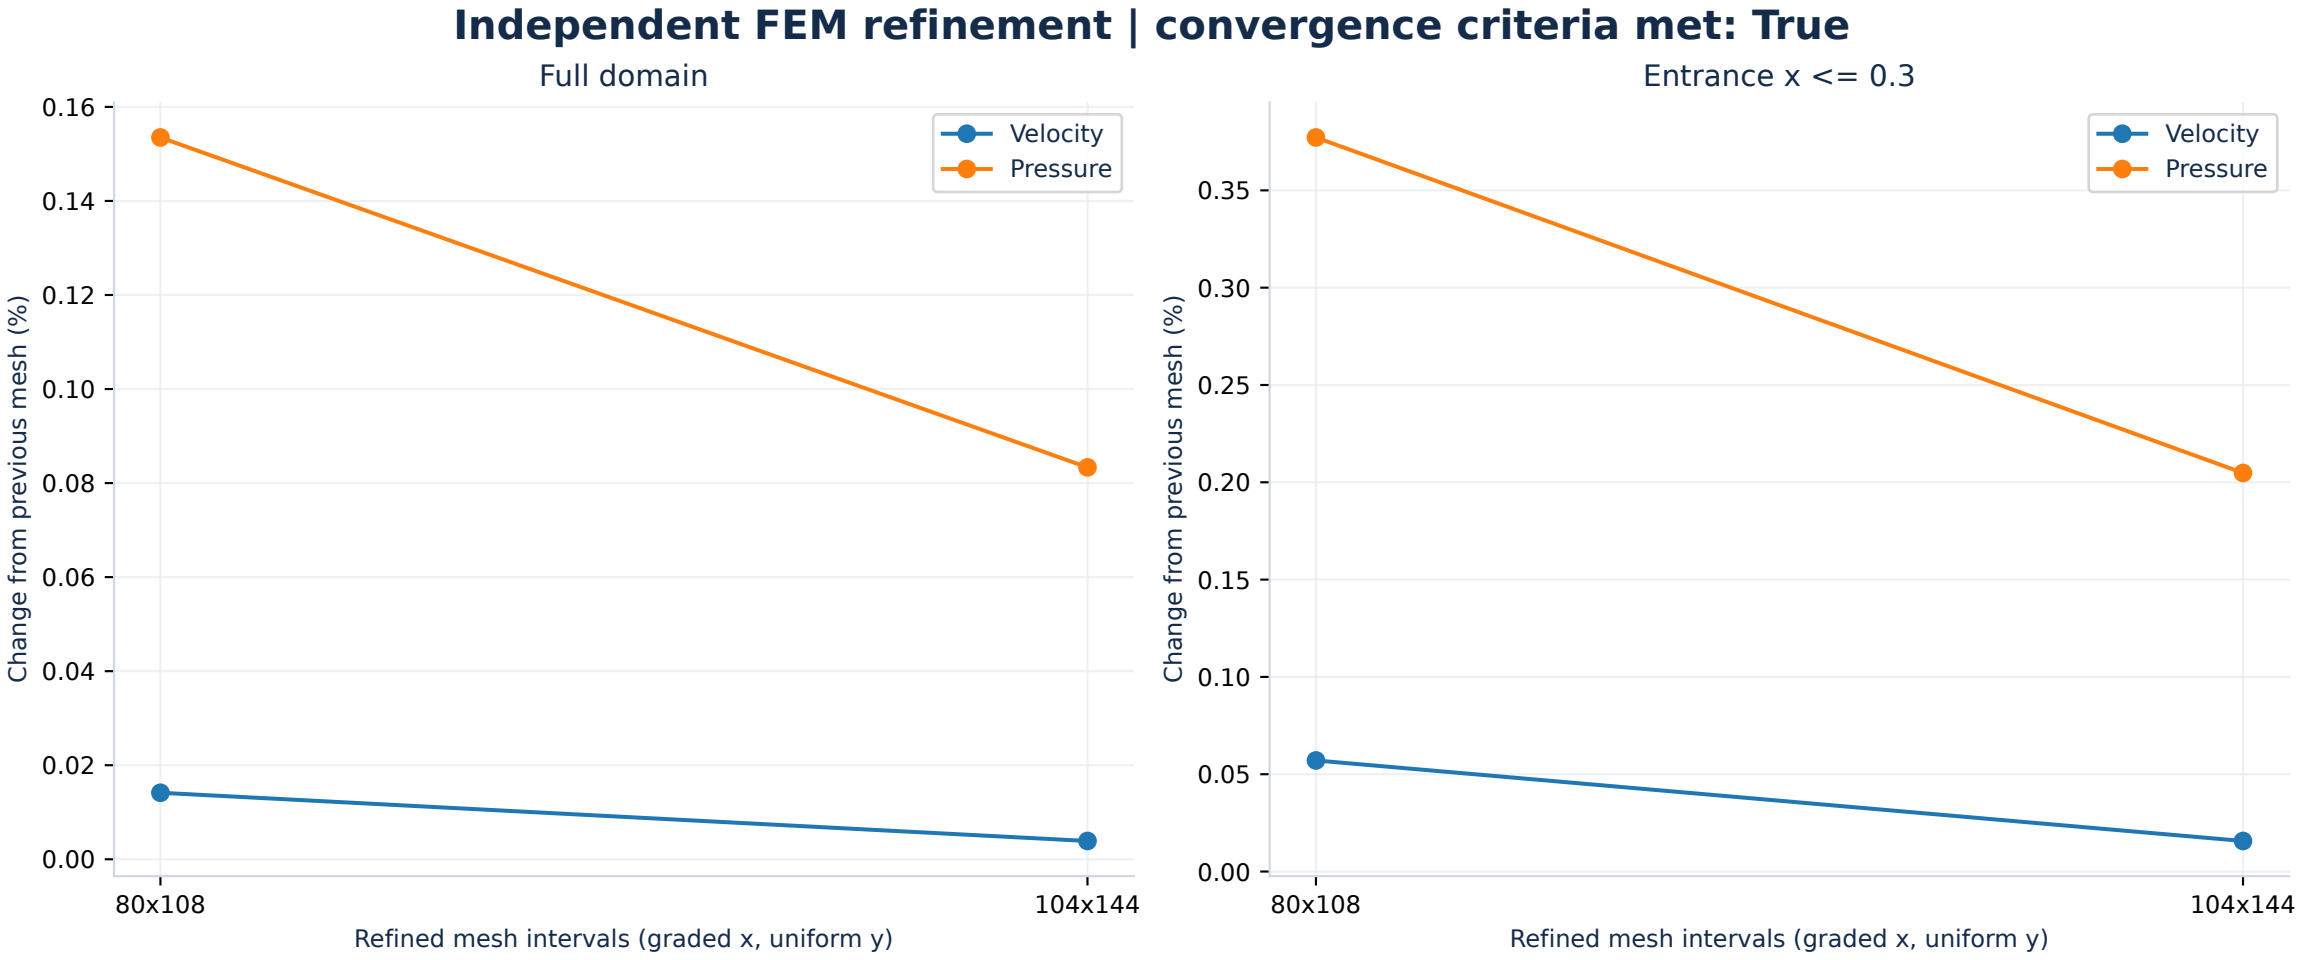

The raw V2 model does not impose the requested 9-peak boundary. This is an OOD failure diagnostic, not a validated solution.

Cross-sections: requested nine-oscillation FEM vs forced V2 evaluation
The inlet boundary conditions differ; frozen V2 is not a valid solution of this new problem.
